# REGIONAL WEED MANAGEMENT PLAN

1.1 PLAN TITLE: **Johnson and Columbus Grass**

1.2 PLAN PROPONENTS

Regional weed advisory committee: Macquarie Valley Weeds Advisory Committee
Address: C/- Cabonne Council, PO Box 17, Molong NSW 2866
Contact person: Cath Kearney, Secretary
Telephone: (02) 6390 7100
Facsimile: (02) 6390 1760
Email: mvwac@cabonne.nsw.gov.au

Signature: Chairman: ………………………………… Date: ………………….

1.3 NAME OF PLANT(S)

Botanical name: *Sorghum halepense* Common name: Johnson Grass
*Sorghum x almun* Columbus Grass

1.4 PLAN PERIOD (not to exceed five years)

Starting date: 01/07/2008 Completion date: 30/06/2013

1.5 AREA OF OPERATION

All Local Control Authorities (LCA’s) and Rural Lands Protection Boards (RLPB’s) of the Macquarie Valley Weeds Advisory Committee.

1.6 AIM

To successfully manage Johnson Grass in the Macquarie Valley.

1.7 OBJECTIVES

1.7.1 Considerably reduce impacts of existing weeds
1.7.2 Prevent new weed problems
1.7.3 Improve coordination and cooperation
1.7.4 Raise awareness of weeds issues within region
2.0 STAKEHOLDERS
2.1 SIGNATORIES

Participating Councils (LCA’s):
- Bogan Shire Council
- Bourke Shire Council
- Brewarrina Shire Council
- Cabonne Council
- Cobar Shire Council
- Dubbo City Council
- Mid Western Regional Council
- Narromine Shire Council
- Orange City Council
- Parkes Shire Council
- Unincorporated area of Western Division
- Wellington Council

Participating County Council:
- Castlereagh Macquarie County Council
- Upper Macquarie County Council

Participating Rural Lands Protection Boards:
- Bourke
- Brewarrina
- Central Tablelands
- Coonabarabran
- Coonamble
- Dubbo
- Hillston
- Molong
- Nyngan
- Walgett

2.2 OTHER STAKEHOLDERS
- NSW Department of Primary Industries (DPI)
- State Forests
- NSW Department of Environment and Climate Change (DECC) – National Parks and Wildlife Service (NPWS)
- Department of Lands
- Catchment Management Authorities (CMA’s)
- Regional Landcare Coordinators
- Aboriginal Lands Councils
- Service providers – Country Energy, Telstra, Australian Rail Track Corp (ARTC)

3.0 BACKGROUND AND JUSTIFICATION
3.1 PLAN JUSTIFICATION AND DESCRIPTION OF PROBLEM
Johnson grass (*Sorghum halepense*) is a serious weed in most parts of the world. Columbus Grass is thought to be derived from a natural cross between an unknown cultivated variety of sorghum and the Johnson Grass weed. Because of the difficulty in distinguishing Johnson Grass from Columbus Grass plants and seeds, Columbus Grass is also declared noxious. Similarly, the seeds of silk forage sorghum and Johnson Grass are very difficult to distinguish from each other. For the sake of this plan, all three species will be referred to as Johnson Grass.

Johnson grass is considered one of the world’s worst weeds. It causes severe crop loss as a result of direct competition, allelopathic action and by acting as an alternate host to crop pests and diseases. While seed spread is the main source of new infestation it is the spread from rhizome segments that exacerbates its problem. Once Johnson grass invades arable lands, cultivation rapidly spreads the infestation. It is capable of taking over whole paddocks where highly productive cultivation land can be severely affected.
The seed sorghum industry is very important in the Macquarie Valley and the possibility of seed contamination is a very serious concern.

3.2 THE 'DO NOTHING' OPTION
If Johnson Grass and Columbus Grass were not controlled, effects would include:

- Decreases in production through increases in pests affecting seed sorghum crops, as Johnson Grass harbours the sorghum midge
- Decreases in production through increases in pests affecting sugar cane crops, as Johnson Grass acts as a host for sugar cane mosaic virus
- Contamination of seed sorghum crops from Johnson Grass pollen
- Increased stock losses as consumption of Johnson Grass rhizomes can cause hydrocyanic acid poisoning in grazing animals such as sheep or cattle
- Increased stock losses as consumption of Johnson Grass rhizomes can cause fatalities in pigs
- Decreases in biodiversity, especially on roadsides, as Johnson Grass is a vigorous competitor
- Increases in infestation sizes and distributions as Johnson Grass spreads quickly, especially after cultivation or grading.

3.3 DISTRIBUTION OF INFESTATIONS
Johnson Grass has spread rapidly in Australia since about 1970 and is a declared noxious plant in the whole of New South Wales. It is a problem mainly on areas that have been cropped and also occurs along roadsides, railway lines and watercourses. The following LCA’s have rare and isolated infestations: Brewarrina, Castlereagh Macquarie County Council and Orange. The following LCA’s have marginal infestations: Bogan, Bourke, Cabonne, Cobar, Dubbo, Mid Western, Narromine, and Wellington. The following LCA’s have core infestations: Parkes.

3.4 WEED BIOLOGY
Seeds germinate in spring and early summer. Seedling growth is slow at first as rhizomes and secondary tillers develop from auxiliary buds on the basal portion of the seedling shoot about 3 weeks after emergence. Growth rate of the leaves increases rapidly thereafter, equally and exceeding the rate of root growth. Rhizome growth rate remains slow until flowering, which commences about 7 weeks after emergence, then accelerates. Flowers and rhizome production continue until autumn, but there are two separate main periods of panicle emergence, early summer, later summer and early autumn. Rhizomes become dormant in late autumn and frosts kill aerial growth. New shoots develop from the rhizomes the following spring. Rhizome shoots exhibit a similar growth pattern but they emerge earlier in the season and due to their greater energy reserves the young plants grow faster in the field than seedling plants and are more dominant.

3.5 METHOD AND RATE OF SPREAD
Seed is the principal means of spread into clean areas although rhizomes may be spread in soil. The detached spikelets are blown in the wind, float on water, stick to wool and fur, and pass relatively unharmed through animal and bird digestive tracks. Seed may also be spread as a contaminant in agricultural produce and in mud sticking to machinery and other vehicles. Localised spread occurs as rhizomes grow away from the parent plant, and when the rhizomes are moved during cultivation and road grading. This spread by rhizomes is what makes the Johnson grass so difficult to control in cultivation land.
3.6 SPECIES MANAGEMENT
As with most species, Johnson Grass requires integrated weed management to achieve successful control.
Physical removal – All parts of the plant must be removed as regrowth occurs easily from fragmented rhizomes
Cultivation – Not generally recommended as it can cause high levels of root fragmentation. However, crop rotation can help to smother Johnson grass infestations. Tillage should cut and bring rhizomes to the surface for desiccation rather than distributing the fragments throughout the site. Crops should include winter-annual small grains and legume forages to smother and out-compete Johnson Grass.
Chemical – Only registered herbicides should be used. Spot spraying is effective selective control. A wick wiper can be used in situations where Johnson Grass is growing taller than desired species.

3.7 KEY LAND MANAGERS
- LCA’s
- RLPB’s
- Landholders
- National Parks
- State Forests
- Department of Lands
- Service providers – Country Energy, ARTC
- RTA

4.0 LEGISLATIVE AND REGULATORY SITUATION
4.1 CURRENT DECLARATION
*Sorghum halepense* and *Sorghum x almun* (Common name: Johnson Grass and Columbus Grass) is declared as a class 3 noxious weed. The plant must be fully and continuously suppressed and destroyed

4.2 DECLARATION CHANGES
No changes in declaration status are anticipated.
5.0 CONSIDERATIONS AND OPPORTUNITIES

5.1 FINANCIAL SUPPORT TO CARRY OUT THE PLAN
The majority of the financial support for this plan will be provided as part of LCA/RLPB weed control programs. Further support will be sought through DPI’s group project funding program. Any other funding source deemed relevant by MVWAC will also be explored.

5.2 LINKS TO OTHER STRATEGIES
- Australian Weed Strategy
- NSW Invasive Species Plan
- MVWAC Regional Weed Strategy
- Catchment Action Plans

5.3 BARRIERS AND CONTINGENCIES
Barriers:
- High levels of regrowth from rhizomes
- Desirability of Silk Forage Sorghum as a pasture species
- Lack of identification skills of land managers
- Spread of seed through the seed sorghum industry

Contingencies:
- Variable seasonal conditions
- Resource shortfall occurs when an ideal seasonal condition allows a prolific growth and such a growth is beyond the resources of individual LCA and Land Managers.

6.0 ACTION PLAN

</tbody>
</table>

| 1.7.4 Raise awareness of weeds issues within region | Johnson Grass to be part of a regional weeds awareness program | Advertisements on television, Field days held, Displays at local shows attended by Weed Officers, Wrest pamphlets distributed to landholders during property inspections, Weed Calendars distributed by LCA’s and RLPB’s | DPI, RPO, LCA weed officers & RLPB rangers |

**7.0 Monitor and Review**
There will be an annual review of the Johnson Grass Regional Management Plan to ensure the performance indicators are realistic and are being met. Member LCA/RLPB’s weed officers and rangers will participate in the review process. This would include discussions on increases or decreases of range, new incursions, successful management strategies, expectations and results.

**8.0 Benefits**
Genuine long term benefits are expected to flow from this plan. The industries expected to directly benefit across the region are:
- Grain Sorghum Seed Production
- Horticulture
- Viticulture
- Cotton
- Other Intensive Cropping
9.0 Resources

Auld, B.A and Medd, R.W 1992 “Weeds” Inkata Press, Victoria
